

ABSTRACT

A system for improved shading of the interior of a building, more specifically, a shade system for use within a door opening of the building where the door opening is serviced by at least one overhead access door, such as a vehicular garage door or rolling service door. The system comprises a flexible fabric shade panel having apertures through the fabric for user access and wind relief. The system may be permanently mounted to an interior portion of the door. The shade panel is raised, lowered and stowed using a spring-assisted rolling storage assembly. The installed system does not interfere with the normal operation of the overhead door.
